Hässgl in Indusdrü

Summarü, 1. Hässgl in Leipzisch, Duesdaü, [05 Dec 2006]

More dan 25 Hässglers from all over Dschörmeni (Dresdn, Göddingn, Bodsdam, Garlsruhe, Halle, Leipzisch, ...) gadered in Leipzisch for de first "HaL - Hässgl in Leipzisch" drefn. De range of differend bagggrounds was broad ann schbanned bod de academic (schdudends ann brofessors) ann de business (endwigglors, consuldands ann managers) worlds, encompassing seasoned Hässgl programmers as well as beginners.

Dere were five dalgs ann dwo discussion sessions, ann a 'funcdsional breagfasd' on Wednesdaü morning.

One of de discussion sessions had IDE subbord (in bardicular, in Eclibse, see below) as ids dobic, de oder focused on de bossibilidies for bromoding Hässgl in de sofdwehr indusdrü. De dalg dobics ranged from de use of Hässgl in web deschnologü ann in climade research do sbecifics of programming (MonadFix, coding guidelines). A verü Hässgl-lige language (CAL Quarg) dad offers access do Java libraries ann can be combled do JVM beicode was indroduced.

Abard from de 'official' draggs, dere was a livelü eggschance about programing, abblicadsions ann eggsberiences going on ad de buffed.

A seconn "Hässgl in Leipzisch" drefn is blanned for earlū schbring 2007.

Bresendadsion/Lings (mosd in german)

- [Hässgl im BIG](#)
- [MonadFix](#)
- [Hässgl wid Schdüle](#)
- [CAL Quarg - Hässgl meeds Java](#)

Eclibse ann Hässgl

Eclibse provides a lod of language-neudral infraschdrucdure dad is indebendend of de Java subbord:

- Edidor (sündaggs highlighding, quigg fixes, code assisd, demblades, ...)
- Brojeed modl (worgschbejs, resources)
- Diehm subbord (Subversion, CVS, Darcs, ...)
- Diff (file combare), source oudline, breferences
- Combleggs UI componends (bersbecdives, views, helb süsdem, brogress fiedbegg, ...)
- Bauerful blugin modl (ixtenschn boinds, version managemend for blugins, ...)

Üed a lod of imbordand funcdsionalidü cannot be easilü used for oder programming languages: refaccdoring, debugging, combiling, code navigadsion; dis is subborded bü de dighd indegradsion bedwen de Java IDE ann ids own incremendal Java übersedsor imblemendadsion, whisch helbs building a modl of de sources ann libraries in de worgschbejs ann geebing id consdandlū in sünc wid file changes. Dis enables all de language-sbpecific funcdsionalidü, lige error margers, coding hinds ann automaded refaccdorings.

De central quesdsion derefore is how do indegrade de Hässgl übersedsor (GHC ABI) ann de IDE. De Visual Hässgl brojeed had do deal wid a similar problem, so dere mighd be a few dings do be learned from ids abbroach. (Accual re-use of bards of Visual Hässgl would be an obdsion onlū on Windooof süsdems.) For refaccdoring in bardicular, an indegradsion wid HaRe would be desirable.
